8-6 Radical Expressions and Rational Exponents

Use **Properties of n th Roots** to simplify radical expressions.

Product Property: $\sqrt[n]{ab} = \sqrt[n]{a} \cdot \sqrt[n]{b}$

Simplify: $\sqrt[4]{81x^8}$.

$\sqrt[4]{3^4 \cdot x^4 \cdot x^4}$ *Factor into perfect fourth roots.*

$\sqrt[4]{3^4} \sqrt[4]{x^4} \sqrt[4]{x^4}$ *Use the Product Property.*

$3 \cdot x \cdot x$
 $3x^2$

Think: $\sqrt[n]{a^n} = a$, so $\sqrt[4]{3^4} = 3$ and $\sqrt[4]{x^4} = x$.

Quotient Property: $\sqrt[n]{\frac{a}{b}} = \frac{\sqrt[n]{a}}{\sqrt[n]{b}}$

Simplify: $\sqrt[3]{\frac{x^9}{2}}$.

$\frac{\sqrt[3]{x^9}}{\sqrt[3]{2}}$ *Use the Quotient Property.*

$\frac{x^3}{\sqrt[3]{2}}$

$\frac{x^3}{\sqrt[3]{2}} \cdot \frac{\sqrt[3]{2}}{\sqrt[3]{2}} \cdot \frac{\sqrt[3]{2}}{\sqrt[3]{2}}$ *Rationalize the denominator.*

$\frac{x^3 \sqrt[3]{2^2}}{\sqrt[3]{2^3}}$ *Use the Product Property.*

$\frac{x^3 \sqrt[3]{4}}{2}$ *Simplify.*

Always **rationalize the denominator** when an expression contains a radical in the denominator.

Simplify the numerator. Think:
 $\sqrt[3]{x^9} = \sqrt[3]{x^3} \sqrt[3]{x^3} \sqrt[3]{x^3} = x \cdot x \cdot x$.

Simplify each expression.

1. $\sqrt[3]{x^8} \cdot \sqrt[3]{x^4}$

2. $\sqrt[4]{\frac{x^8}{6}}$

3. $\sqrt[3]{125x^6}$

$\sqrt[3]{x^8 \cdot x^4}$

$\frac{\sqrt[4]{x^8}}{\sqrt[4]{6}}$

4. $\sqrt[5]{\frac{64}{2x^{10}}}$

5. $\sqrt[3]{2x} \cdot \sqrt[3]{4x^2}$

6. $\sqrt[4]{625x^8}$

8-6 Radical Expressions and Rational Exponents (continued)

The n th root of a number can be represented using a rational, or fractional, exponent: $\sqrt[n]{a} = a^{\frac{1}{n}}$.

This means to take the n th root of a .

Examples: $121^{\frac{1}{2}} = \sqrt{121} = 11$
 $216^{\frac{1}{3}} = \sqrt[3]{216} = 6$
 $256^{\frac{1}{4}} = \sqrt[4]{256} = 4$

Powers and roots can be expressed using rational exponents $a^{\frac{m}{n}} = (\sqrt[n]{a})^m$.

Examples:

$64^{\frac{2}{3}} = (\sqrt[3]{64})^2 = 4^2 = 16$
 $(-32)^{\frac{4}{5}} = (\sqrt[5]{-32})^4 = (-2)^4 = 16$

The denominator is the root and the numerator is the power.

To write expressions using rational exponents, use the definitions.

$\sqrt[n]{a} = a^{\frac{1}{n}}$ and $\sqrt[n]{a^m} = a^{\frac{m}{n}}$

Note that $(\sqrt[n]{a})^m = \sqrt[n]{a^m}$.

Examples: $\sqrt{5} = 5^{\frac{1}{2}}$

$\sqrt[4]{6^3} = 6^{\frac{3}{4}}$

Think: The root is $n = 4$.
The power is $m = 3$.

Write each expression in radical form and simplify.

7. $27^{\frac{4}{3}} = (\sqrt[3]{27})^4$

8. $49^{\frac{3}{2}}$

9. $16^{\frac{3}{4}}$

Write each expression by using rational exponents.

10. $\sqrt[5]{4^2}$ Think: $m = 2, n = 5$

11. $\sqrt{19}$

12. $\sqrt[4]{6^5}$

Simplify each expression.

13. $(\frac{24}{3x^3})^{\frac{1}{3}}$

14. $\sqrt{49} \cdot \sqrt[3]{8x^6}$

15. $\sqrt{\frac{117}{13}}$

8-6 Radical Expressions and Rational Exponents

Louise is building a guitar-like instrument. It has small metal bars, called frets, positioned across its neck so that it can produce notes of a specific scale on each string. The distance a fret should be placed from the bridge is related to a string's root note length by the function $d(n) = r(2^{-\frac{n}{12}})$, where r is the length of the root note string and n is the number of notes higher than that string's root note. Louise wants to know where to place frets to produce different notes on a 50-cm string.

- Find the distance from the bridge for a fret that produces a note exactly one octave (12 notes) higher than the root note.
 - Substitute values for r and n in the given function. $d(12) = 50(2^{-\frac{12}{12}})$
 - How far from the bridge should the fret be placed? $\underline{25 \text{ cm}}$
 - What fraction of the string length is the distance of this fret from the bridge? $\underline{\frac{1}{2}}$
- Complete the table to find the distance from the bridge, for frets that produce every other note of an entire scale on this string.

LESSON **Challenge**
8-6 Using Rational Exponents

Rational exponents make it possible to simplify radical expressions. Consider the simple operation of multiplication of radicals. Is it possible to multiply the radical expression $\sqrt{2} \cdot \sqrt[3]{2}$? When written in radical form the answer is no, or at least it is very difficult. When written in exponent form it may be done as follows:

$$\sqrt{2} \cdot \sqrt[3]{2} = 2^{\frac{1}{2}} \cdot 2^{\frac{1}{3}} = 2^{\frac{1}{2} + \frac{1}{3}} = 2^{\frac{3}{6} + \frac{2}{6}} = 2^{\frac{5}{6}} = \sqrt[6]{2^5} = \sqrt[6]{32}$$

When you look at the radicals, it may not be obvious that the first and last expressions are equal. The operation with rational exponents verifies the result. Other fraction operations are possible when using rational exponents instead of radicals.

$$\sqrt[3]{2} \cdot \sqrt[5]{3^2} = 2^{\frac{1}{3}} \cdot 3^{\frac{2}{5}} = 2^{\frac{10}{15}} \cdot 3^{\frac{6}{15}} = (2^5 \cdot 3^6)^{\frac{1}{15}} = \sqrt[15]{2^5 \cdot 3^6} = \sqrt[15]{23,328}$$

Once again, the radical operations are quite difficult, but the rational exponents greatly simplify the multiplication.

Simplify. Assume all variables have positive values.
